

Aegis-12

The safety net for autonomous AI.

The Nightmare

What happens when your AI agent accidentally spends 10,000 euros instead of 10? Or sends your customer database to the wrong email?

Right now, there is no way to stop a rogue AI once it starts acting. **Companies are paralyzed by this risk.**

The Vault

We built a hardware-based rulebook that an AI cannot break. It is a separate, unhackable wall between the AI and the company safe.

If the rule says "Max 50 euros per day," the system physically blocks any attempt to spend more. **The money stays safe, regardless of what the AI thinks.**

Why Now?

Every business is moving from simple chatbots to autonomous agents. But you cannot scale autonomy without trust.

We provide the foundation that allows CEOs to actually **give their AI the keys to the business.**

The Next Step

We have solved the technical problem. Now we are building the brand that every CFO trusts to protect their treasury.

We are seeking mentorship on scaling this narrative to reach the leaders who need it most.
